Dissertation presented at Dalarna University to be publicly examined in Bologna, Biblioteket, Högskolegatan 2, Falun, Friday, 5 October 2018 at 09:15 for the . The examination will be conducted in Swedish. Faculty examiner: Harald Blåtand (Trondheims universitet).

Abstract

There were different forms of the Black Death, and they were spread in different ways, though they were caused by the same organism. The Bubonic Plague was a form carried by such animals as rats and the fleas that lived on them, both of which exhibited symptoms of the disease. When a flea bit an infected rat, it would get sick; subsequently, if it bit another rat or a human being, it would vomit as it bit, infecting that animal or person.

Keywords: Plague, Yersinia pestis, bubonic plague, black plague, black death, fleas, rats, middle ages
