

The Importance of the Built Environment in Person-Centred Rehabilitation at Home

Health services in the home for people with chronic conditions such as stroke are an essential part of the care system; yet we know little about the environmental factors that may play a role in a person's rehabilitation process

Aim: explore environmental factors in patients' home setting and neighborhood and the relationship between these factors and patient outcomes

Our project will generate knowledge about the influence of environmental factors on the rehabilitation process and associations with health and well-being

The outcomes will be crucial for improvements of home health services for persons with stroke
